- **What is urban forestry?**

An aerial photograph of a village with small houses and trees, overlaid with a large green leaf graphic on the right side. The leaf has a black outline and is filled with a green color. It has a long stem that points towards the top right corner of the image. The background is a dark, slightly blurred aerial view of a village with small houses and trees.

Goals

Global, inclusive and accessible

- **Level playing field**
- **Skills–based learning**
- **Accessible material**

Level playing field

- **Vast array of disciplines and professional backgrounds**
- **Personal background**
- **Global context**
- **Local reality**

Introduction to Urban and Peri-Urban Forestry

Who should take this course?

This course is primarily intended for **individuals responsible for planning, designing, or managing urban forests**, including those working in **public or private organizations** and those in the **voluntary sector**. This may include:

*Click on each person to learn
about their interest in this course*

Policymakers

**Development
organizations and
voluntary sector**

**Planners, researchers
and practitioners**

Landowners and trusts

I work for a trust, which manages areas of urban land which include many trees. I would like to better understand how our work can contribute to a coherent urban forest strategy in our city, and that we can play a role as stakeholders in the process.

Skills-based learning

- **Introduction to urban forestry**
- **Directly applicable and practical skills**
- **Focus on what, how, why**
- **Invitation for further exploration**

Accessible material

Content:

- **Learner backgrounds**
- **Learning styles**
- **Global representation**

Accessible material

Content:

- **Learner backgrounds**
- **Learning styles**
- **Global representation**

Infrastructure:

- **Free of charge**
- **Sensitive to available time**
- **Access to internet**
- **Open access resources**

Approach

FAO eLearning Academy

4 QUALITY
EDUCATION

- Targeted, learner-centred design
- Interdisciplinary team
- Peer review
- Assessment and certification

About this course

Welcome to this course on Urban Forestry

This e-learning course aims to provide an **introductory** and **elementary understanding** of **urban** and **peri-urban forestry** concepts. It focuses on issues around definitions and introduces ideas around the planning, design and management of urban and peri-urban forests.

2nd World Forum on Urban Forests

An introduction to Urban and Peri-Urban Forestry

Introduction and basic concepts

1

Welcome to Lesson 1.

This lesson provides an overview of urban forestry and the importance of urban forests for sustainability.

It provides a foundation, with key urban forestry concepts, and describes the relationship between urban forests and peri-urban forests adjacent to the city.

30 minutes

1

Introduction and basic concepts

Learning objectives

At the end of this lesson, you will be able to:

- define urban forestry;
- explain **key terms** and **concepts** associated with urban forestry;
- describe the **process** of **planning, designing and managing** urban forests;
- explain the **relationship** between **urban forests** and **forests outside of urban contexts**; and
- describe the contribution of urban forests to the **UN Sustainable Development Goals (SDGs)**.

1

Introduction and basic concepts

Introduction

Welcome! My name is Geetha. I work as an urban forestry consultant.

I will be guiding you through this course material, and you will be joined by Iciar and Alex here.

The planning, design and management of urban forests Community-led urban forestry

If urban forests are imposed on communities, they are likely to lead to negative feelings. The appreciation of trees in and around urban areas is highly dependent upon their **acceptability to local communities**, and working with communities at all stages increases the likelihood of success.

Enabling individuals to develop a **sense of ownership** of local trees improves the chances of reaching tree maturity and engaging people in the trees' protection and day-to-day maintenance.

4 Urban forestry challenges in a changing world Moving on

Well, Iciar and Alex, we are at the end of the course now, and I hope it has deepened your understanding of urban forestry

It certainly has, Geetha. I am particularly interested in the long term benefits of urban forestry, and I'm keen to discuss with my colleagues how we can ensure our urban forest management plans include long term plans and monitoring and evaluation throughout.

Yes, thank you Geetha! I now understand the importance of the community for a successful urban forest strategy, and the benefits of urban forests for the community. I will discuss this with the local communities I work with.

Launching soon!

Abstract

Crown widths of woody plant species growing in urban areas are of considerable importance as an overall indicator of health and also serve as an important factor for assessing leaf area and associated ecosystem services, such as carbon sequestration, air pollution removal, air temperature cooling, and rainfall interception. Unfortunately, assessing crown widths in urban environments is often challenging and time consuming. To help reduce data collection costs and provide consistency over time, models to predict crown widths for urban-grown species were developed using data from 49 cities across the U.S. and Southern Canada. The effort consisted of fitting mixed models for 29 species groups that encompassed 964 species. Cities were considered a random effect and were statistically significant for 22 of the 29 groups. The need for urban-specific crown width models was demonstrated via examination of prediction biases found when applying crown width models based on forest grown trees, where under-prediction up to about 20% was found for the same species growing in urban areas. Application of the models was evaluated by using crown width predictions instead of observed values for calculations of crown leaf area. Mean percent differences in leaf area were about $\pm 10\%$ across most species groups. Further improvements to national-scale urban crown width models should be pursued as additional data become available via i-Tree, Urban FIA, and possibly other sources where data collection protocols are compatible.

^aResearch Institute on Terrestrial Ecosystems (IRET), National Research Council (CNR), Porano, Italy; ^bInstitute of Meteorology and Climate Research, Atmospheric Environmental Research (IMK-IFU), Karlsruhe Institute of Technology (KIT), Garmisch-Partenkirchen, Germany; ^cDepartment of Environmental Resources Engineering, SUNY ESF, Syracuse, NY, USA

ABSTRACT

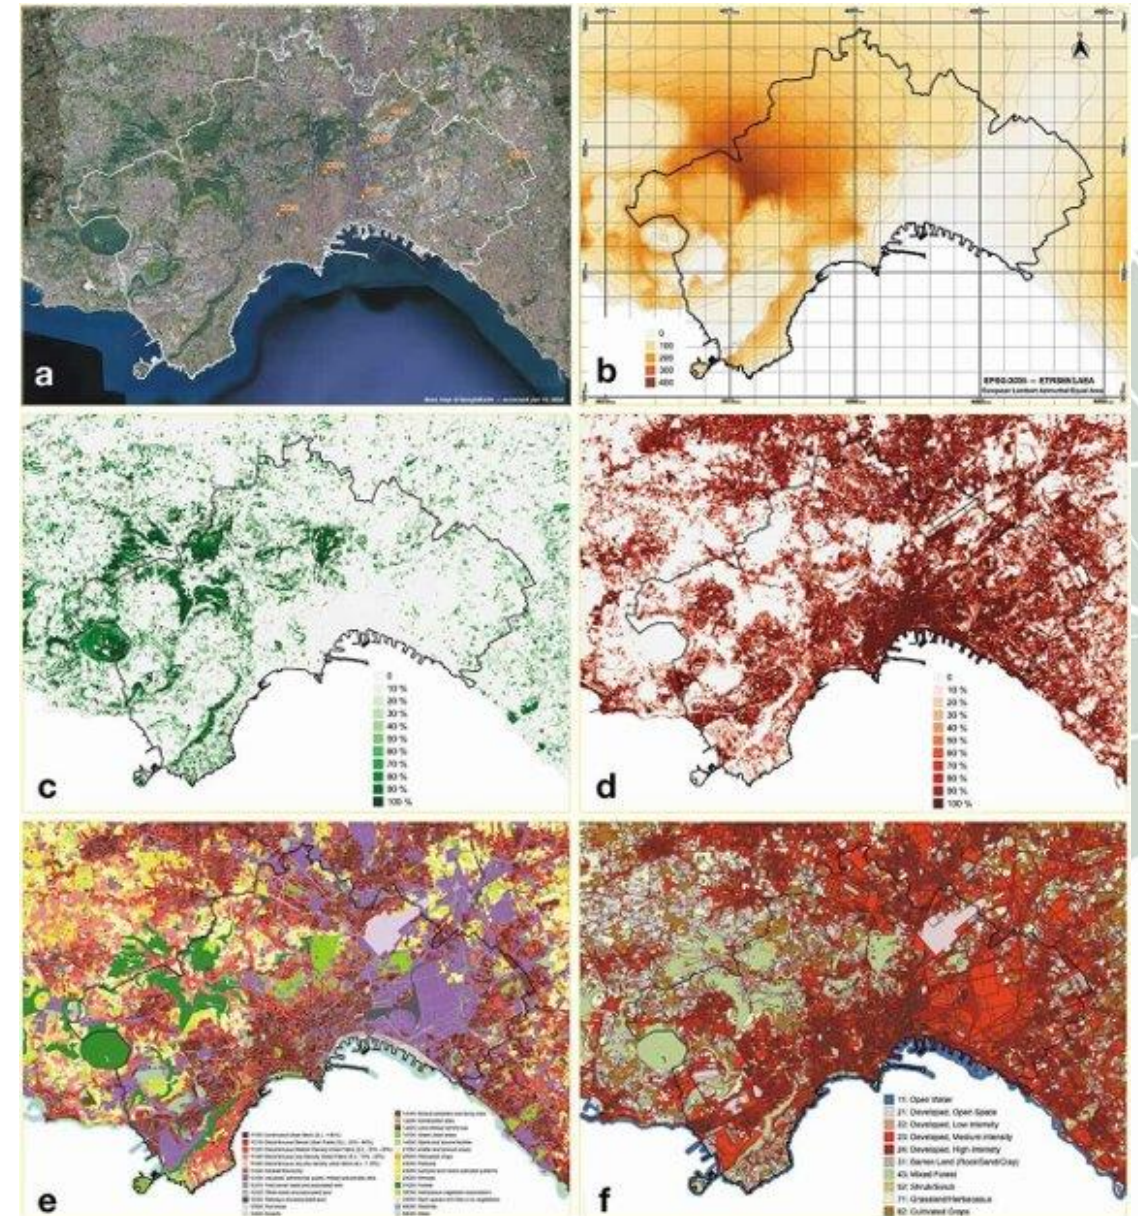

Cities host more than half of the world's population and due to global warming and land use change their vulnerability to deadly heat waves has increased. A healthy vegetated landscape can abate heat wave severity and diminish the related urban heat island through the process of evapotranspiration. This research aimed to develop a methodology for cities to use publicly available Copernicus land cover maps within the i-Tree Cool Air water and energy balance model to map air temperature and humidity. The manuscript presents proof of concept using Naples, Italy with its Mediterranean climate characterized by limited soil water for cooling via evapotranspiration. The approach achieved strong correlations between predicted and observed air temperatures across the city ($r \geq 0.89$). During the warm season of 2020, forested land cover was 5°C cooler than land cover dominated by impervious cover. Simulated land cover change, limited to a 10% increase or decrease in tree cover, generated an inverse change of 0.2°C in maximum hourly air temperature, with more trees obtaining cooler air. Soil water limited the cooling, with the generally wetter spring season enabling greater cooling of air temperatures, and summer droughts without irrigation had constrained cooling. Sustainable urban design will likely require an increase in plant cover along with a reduction of impervious surfaces that absorb and reradiate heat in order to improve community resilience to heat waves.

Help

Data > Inventory Data > Plots

The Plots function seen in the action panel to the right is where you can enter or edit the plot data that you collected in the field (see Notes below). The upper table displays your plot data. While working in this table, you may use the tools in the Actions group to help manually enter new data or edit data that has already been added.

Steps to Viewing Plot Data:

- When you click on a record in the plot table, additional plot data will be displayed in the table below it.
- Use the tabs located at the bottom of the action panel to view different plot data in the lower table.
- Hide the lower table by clicking on the pin button in the upper right-hand corner of the table.
- Unhide the lower table by clicking on one of the tabs at the bottom of the action panel and clicking on the pin button again.

Steps to Manually Add/Edit Data:

- Click in the box where you would like to enter data and begin typing.
- Use the Tab key on your keyboard or the left and right arrows to move from

2nd World Forum on Urban Forests

Washington DC, 2023

Transdisciplinary and arts-centered approaches to stewardship and sustainability of urban forests

Presented by

Lindsay K. Campbell, PhD

Co-authors: Chris Fremantle, David
Maddox, Erika Svendsen, Sarah Hines,
Mary Mattingly, Matthew López-Jensen,
Nikki Lindt, Liza Paqueo, Michelle Johnson

Context

- Climate change, unsustainable development, and systemic inequality produce ‘wicked problems’ that require multidimensional thinking and practice.
- Arts offers a distinct ‘way of knowing’ and a novel approach to these problems.
- Transdisciplinarity addresses complex challenges and values different forms of knowledge.

Approach: Urban Field Station Collaborative Arts Program

- We build understanding of and engagement with urban forests and social-ecological systems through arts.
- We facilitate transdisciplinary collaboration between artists, scientists, and land managers.
- We curate events and public programs that explore ideas emerging from these collaborations.

(www.ufsarts.com)

Materials and Methods

- UFS Arts programmatic data from 2016-2023, including:
 - Organizing team field notes
 - Group debriefs from quarterly UFS Arts all hands meetings
 - Artists' program evaluation assessments
- Case studies:
 - Matthew López-Jensen's *Tree Love*
 - Nikki Lindt's *Underground Sound Project*
 - Mary Mattingly's *Swale*
 - The UFS exhibition *Who Takes Care of New York?*

Sensitizing us to the capacities of trees and forests

(Left to Right: *Tree Love* by Matthew López-Jensen;
Underground Sound Project by Nikki Lindt)

Critical provocation, social practice art, and productive landscapes

(Swale by Mary Mattingly)

Amplifying stories of community stewardship

*(Who Takes Care of
New York? Photos

Pinckney, NYC Parks)*

Discussion

How do collaborations between artists, scientists, and land managers transform stewardship practices?

1. By posing new types of questions, art can create an opening for critical reflection in land management.
2. Art can engage multiple ways of knowing and making meaning of place, land, and ecosystems; these modes have the potential to engage a wide range of diverse publics.
3. Art can recognize and engage in two-way learning and dialogue across differences.

Join us!

- Urban Field Station Collaborative Arts Program welcomes new artists and collaborative partners – contact us.
- Current 2024 call for artists is open at: www.ufsarts.com.

Washington DC, 2023

USDA Forest Service, Forest Inventory and Analysis (FIA) Program

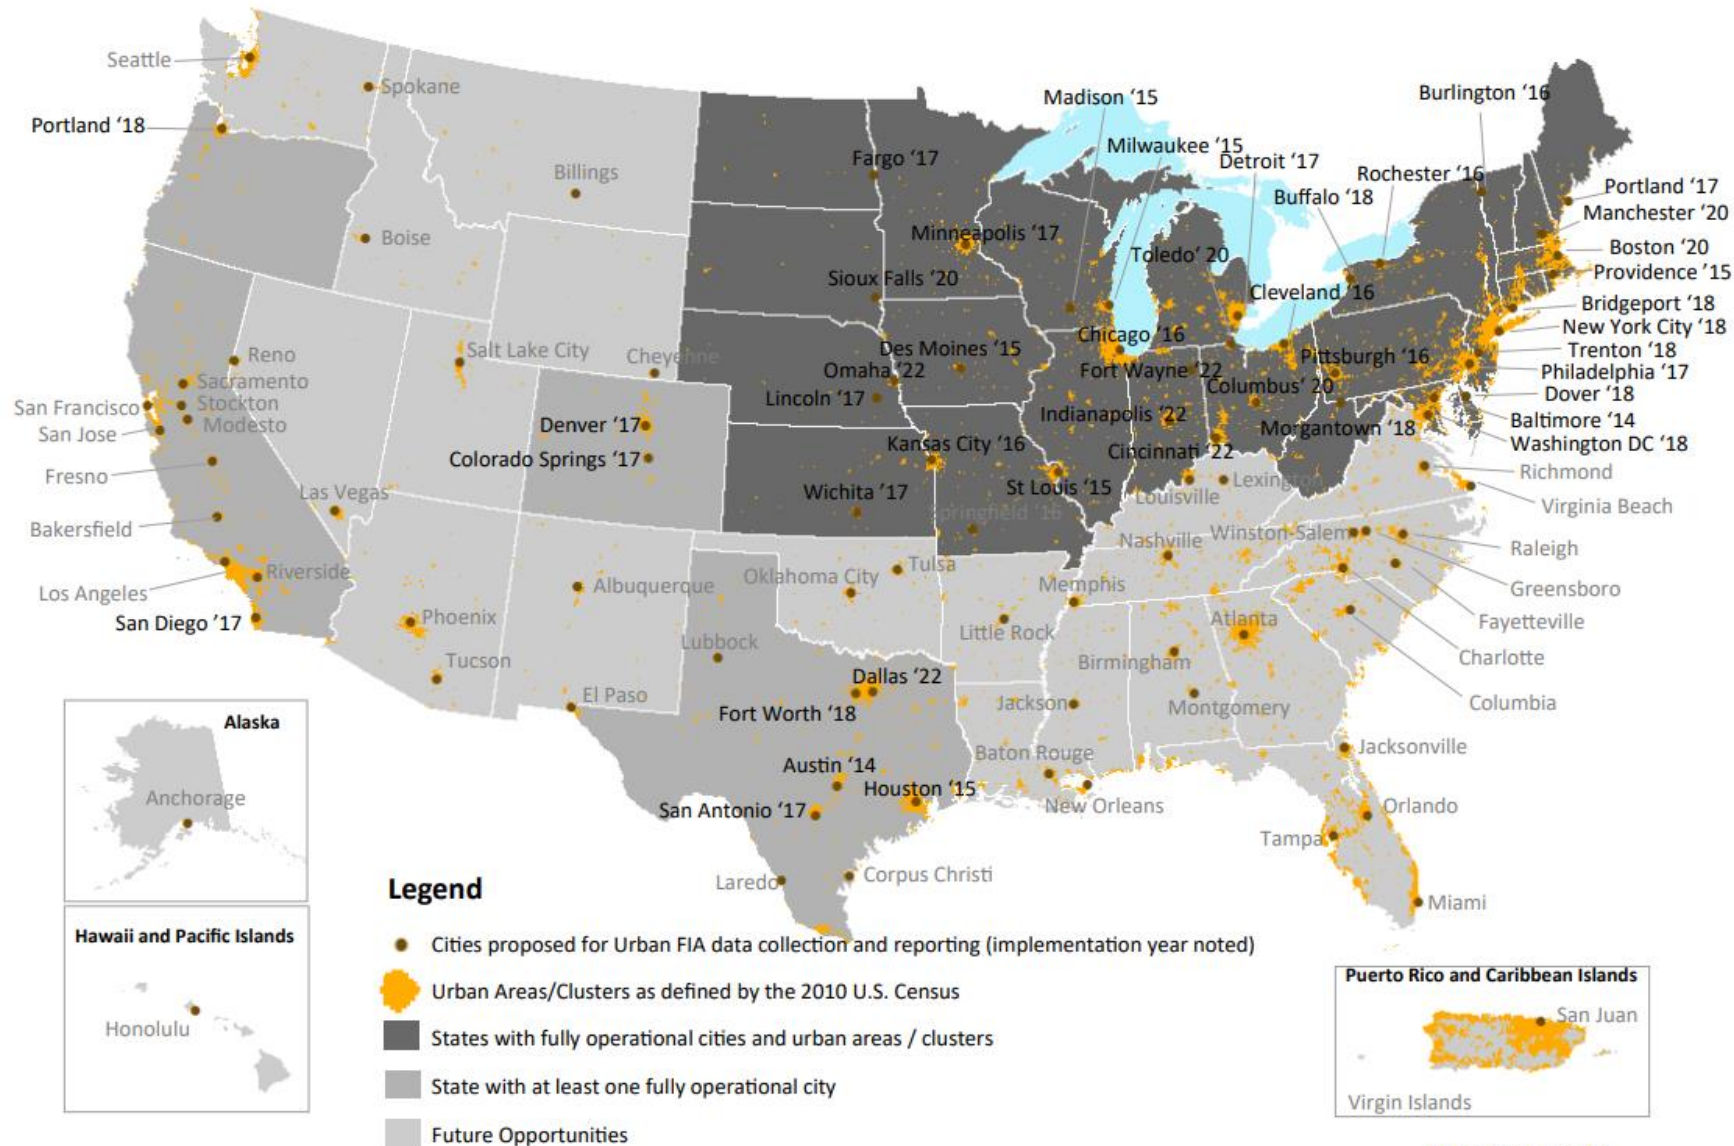

FIA field crews sample more than 130,000 forested plots (represented by dots) to compile the inventory. These plots are found throughout the continental United States, Alaska, and the Nation's territories in the Caribbean and Pacific.

Urban FIA Program Goal

- **Annually monitor the forests of all U.S. Census-defined urban areas with a special emphasis on the largest cities in the nation.**
- **UFIA is currently initiated in 44 cities, in 28 states with 24 statewide urban area projects.**

Urban FIA Data-FIA core variables

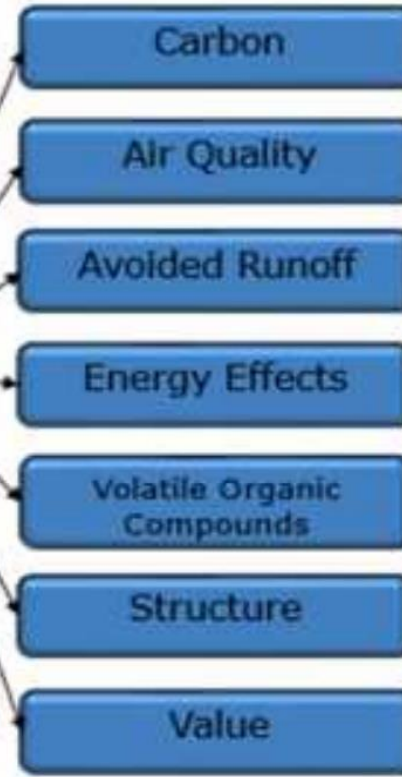

- **Tree data--species type, tree measurements, damages, health, and condition...**
- **Site conditions –land use, ownership, veg and surface cover**
- **Percent cover of selected invasive plant species...**
- **Derived estimates of volume, biomass, and carbon**
- **Change data and trend estimates with remeasurement data**

Integration of i-Tree Eco Methods

Urban FIA Data

FIA Data Processing

- **Certification**
- **Estimation**
- **Posting to public database**

Estimate Parameters

Estimate: Area of herbaceous cover,

Geography: StLouis2021Curr

Grouping Variables:

- FIA land use

- Nonsampled reason

Note: '-' indicates no value for data table reader, it is recommended to adjust view screen reader settings.

Estimate:

FIA land use	Total
Total	222,630
Forest land	21,937
Agriculture	2,120
Commercial/Industrial	37,160
Residential	121,361
Multi-family Residential	2,204
Recreation/Cemetery	16,795
Rights-of-Way	20,869

Sampling error percent level 68%):

Note: for 95% confidence level multi

FIA land use	Total
Total	3.653
Forest land	17.689
Agriculture	87.973
Commercial/Industrial	16.085
Residential	6.923
Multi-family Residential	38.676
Recreation/Cemetery	26.090
Rights-of-Way	19.469

Highlights:

- The pool of urban FIA data is growing.
- My City's Trees provides users easy access to Urban FIA data and more tools are in development.
- The social vulnerability theme in the MCT app helps users explore the equity of tree resources and benefits in a city.
- The data suggest that in select cities like Greater St. Louis and Washington, DC more socially vulnerable tracts may have lower tree density and tree benefits, but further research and exploration of sampling errors is needed.

Urban FIA is working on:

- State or region-level urban forest analyses
- Analyses of remeasurement data
- Annual reporting of urban FIA data and the development of online, interactive content/dashboards

Branding and Identity in Arboriculture – Why it matters in expanding diversity

Presented by

Luana Vargas
International Society of Arboriculture
ATD Certified Professional in Talent
Development

What's in a brand?

A compilation of written, verbal, and nonverbal cues that tells a story about your product or service.

This was our brand...

What messages or
stories does it convey?

TM

The data behind it, declines or stagnation in:

- Overall number of credentials held
- Female credential holders

What did we do with the findings?

Brand naming and design evolution

2nd World Forum on Urban Forests

Washington DC, 2023

Our new look

Does it stop here with the rebrand?

- Intentionality of inclusion through different media
- Building diversity and inclusion inside and out

Intentional, inclusive language and imagery
